Tax Accountant in a Box

Your practice, with the admin taken off your desk

Built for small tax practices in Malaysia

You did not train for this part

Where the hours actually go in a small practice

1

Chasing documents

The same email, three times, to eleven clients. Then checking who replied and what is still missing.

2

Re-typing figures

Bank statements, receipts, payroll. Numbers that already exist somewhere, keyed in again by hand.

3

Holding it all in your head

Which client is ready, whose year end falls when, what is due in three weeks.

None of it is the work you are actually qualified to do.

THE IDEA

**Not a new system to learn.
Your own way of working, with help.**

You keep your folders, your clients, your judgement. What changes is that the repetitive half stops being yours to do by hand.

One engagement, start to finish

The same seven steps for every client, every year

Steps 2 and 4 are where your week goes.

They are also the two that automate best, because they are repetitive rather than a matter of judgement.

Who does what

You are in every loop. Nothing happens without you

Every step of yours is a review, not a first draft.

Nothing is sent, filed or decided without you looking at it first.

Where the line sits

This matters more than any feature on the previous slides

Claude does

- Builds and fills your client folders
- Tracks what each client still owes
- Writes the chasing emails
- Pulls figures out of documents
- Drafts the computation and asks questions
- Watches every deadline

You decide

- Whether every figure is right
- The tax treatment of every item
- The filing position you take
- What goes to your client
- What goes to LHDN
- When something needs a second look

Claude never decides a tax treatment. That is a design choice, not a limitation waiting to be fixed.

What changes on a Tuesday

Chasing eleven clients for their year-end documents

Today

- Open the file, work out what is missing
- Write each email from scratch
- Try to recall who was chased last week
- Repeat, eleven times

Half a morning, every week

With this

- “Who hasn’t sent me their documents?”
- A list back, with what each one owes
- Eleven drafts written, firmer where overdue
- You read them, edit two, send

Fifteen minutes

It knows what to ask for because it knows what a Form C client owes, and what this client already sent.

Deadlines stop living in your head

Every client date, worked out once and kept current

Form E

31 March

Form BE

15 May

Form B

15 July

Form C

8 months after year end

CP204

Before the basis period

MITRS

30 days after filing

Ask at any time: “Who is due in the next month, and who is not ready?”

You also get the date that actually matters: when documents must be in hand to still file on time. Not the deadline itself, which only tells you when it is already too late.

Your client data

The question you should be asking, answered before you ask it

It stays on your computer

Client folders live on your machine. Nothing is uploaded anywhere as a matter of course.

You choose every connection

Email and calendar are connected by you, one at a time, and switched off whenever you like.

Nothing sends itself

Every email, every filing, every calendar entry waits for you to approve it.

Figures never leave the folder

Chasing messages ask for documents. They never mention what is in them.

Your MIA confidentiality obligations and the PDPA are yours to satisfy. This is built so that staying inside them is the default, not something you have to remember.

What it will not do

Better you hear this now than find out in week two

It cannot open email attachments

It sees that a file arrived and what it is called. You save it into the client folder yourself.

It cannot file for you

There is no connection to MyTax or MITRS, and there will not be one. You submit.

It cannot read bad handwriting

Clear scans and digital files work well. Photographs of crumpled receipts get flagged, not guessed.

It cannot decide a treatment

It drafts the computation and raises the questions. Every judgement stays yours.

Everything else on the previous slides, it does today.

Twenty minutes to your first client

No migration, no training course

01

Install

The Claude desktop app, signed in with the account you already have.

02

Say “set up my practice”

It asks a few questions and sets everything up for you.

03

Add one client

Make a folder, answer five questions. Not your whole book, just one.

04

Try it for a fortnight

Use it for the chasing. Decide whether it earned its place.

Everything stays on your computer. If you stop using it, your files are exactly where you left them.

Start with a conversation, not a purchase

A Professional Health Check is ninety minutes. We walk your actual workflow, find where your hours really go, and you leave with a written roadmap whether or not you go further.

90 minutes

One conversation about how you work

A written roadmap

Yours to keep, whatever you decide

No commitment

Nothing to install to have the conversation
